

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

Claims 1-8 (cancelled).

9. (Currently Amended) An optical pickup head device comprising:
a laser diode capable of emitting which emits linear polarized light with the 45 degree phase angle difference;
a polarized beam splitter for transforming said light which reflects the original linear polarized light into right-hand circular polarized light and further bypassing a passes through the left-hand circular polarized light;
a collimator for aligning said which corrects the right-hand circular polarized light in parallel to parallel light;
an objective lens for focusing said which focuses the right-hand circular polarized light onto an to optical disk, said right-hand circular polarized light further carrying out signals from said optical disk which reflected by optical disk in which reflected light is a left hand circular polarized light; and
a photodetector for detecting said signals which detects the signal with polarized light.

10. (Currently Amended) The optical pickup head device as claimed in claim 9, wherein said the polarized beam splitter generates can produce -45 degree phase angle difference for feeding back a feedback polarized light to said laser diode, in this case, said feedback polarized light will not interfere said linear polarized light since there is a phase angle difference from 45 to -45. The feedback polarized light with 45 degree phase angle going to light source has a phase shift 90 degree compared with original linear polarized light.
